Noni Concentrate

INGREDIENTS
Doctor’s Best Noni contains pure dried Morinda citrifolia fruit, commonly known as Noni. The Morinda citrifolia plant has a long history of traditional use in Southeast Asia and the South Pacific for a spectrum of healthful purposes. As ancestors of Polynesians migrated from Southeast Asia two millennia ago, they presumably brought with them plants that were valued for their nutritional content and other health-promoting qualities. Scholars believe that noni was very prominent among the plants that were brought to Polynesia to help the migrants maintain health. Polynesian mythology relates a number of stories where noni is central to the hero averting famine. In more recent times, noni fruit was recognized as a food source in a field manual issued to U.S. soldiers during World War II. The fruit is known as a good source of potassium and other minerals, and its nutritional profile includes several fatty acid glycosides that appear to be unique to noni when the fruit is ripe. Since it is today found in most tropical regions, noni also goes by many other names, including Indian Mulberry, Hai Ba Ji, Cheese Fruit, and Nhau.

BENEFITS
Multifaceted Antioxidant Support*
Helps Maintain Healthy Cellular Lifecycles and Growth*
Abundant in Phytochemicals
As of 2010, over 100 bioactive compounds have been discovered in noni fruit. Among the phytochemical classes are flavonoids (including rutin & quercetin), coumarins (scopoletin), fatty acids, chloroforms, lignans, phytosterols (-sitosterol), polysaccharides, and terpenoids. Researchers speculate that this diversity of compounds—their potential to enhance health in humans—could explain the equally diverse traditional uses for noni fruit over for centuries. In vitro examination of noni fruit extract revealed antioxidant activity as potent as that of vitamin E.

Four saccharide fatty acid esters from noni fruit, including one that was newly discovered, displayed anti-inflammatory activity in mice that was even more potent than the action of quercetin, which is another natural compound found in noni and one that is revered for its antioxidant and inhibitory activity. Another study that discovered two new lignans in noni fruit also found that these lignans—in addition to several other compounds—have anti-inflammatory enzymes found in humans, in vitro. In yet another study that investigated inflammation and immune response, noni fruit puree was used experimentally both in mice and in human monocyte (white blood cell) culture. The results were impressive in both respects, demonstrating inhibition of MMP-9 (a marker of inflammation) in the cell cultures and inhibition of inflammatory enzymes in the mice.

Iridoids: Not found in your average fruit
Iridoids are a class of plant compounds that have demonstrated a wide range of bioactivity, including physiological actions that have potential to enhance health in humans. While most fruit abounds with various flavonoids, this is not the case with iridoids. Noni, on the other hand, boasts a higher content of iridoids than flavonoids—including an unusual and active iridoid named citrifolin A that shows remarkable activity in vitro.

The major iridoids in noni fruit, as determined by HPLC analysis done in 2010, are deacetylasperulosidic acid (DDA) and asperulosidic acid (AA). Having worked extensively with noni, the researchers making this discovery proposed that the DDA & AA may be contributors to many of noni’s wide spectrum of health-promoting effects. Animal studies have illustrated the utility of asperulosidic acid in promoting the maintenance of healthy cell function in the face of extreme adversity (toxic insults). Additionally, deacetylasperulosidic acid has been found in vitro to inhibit lipid oxidation at a strikingly high level for a natural compound.

Supplement Facts
Serving Size 2 veggie capsules
Servings per container 60 servings

Leading Edge Noni Findings

In a 2010 study of rats put on a high-fat diet, some of the rats were also fed noni fruit extract. The fruit extract helped a subgroup of rats in the study maintain a significantly more preferable level of blood lipids than those not receiving the noni extract. The researchers believe that Morinda citrifolia achieves these results in part through the inhibition of HMG Co-A, but that other mechanisms—such as the flavonoid content of noni—are probably also contributing to the inhibition of lipid biosynthesis. Furthermore, they conclude that the high antioxidant content of noni can be the oxidative stress caused by the amount of lipid biosynthesis that does occur. The results from this animal study have further paved the way for clinical investigations to be carried out in order to clearly define the potential cardiovascular benefits of noni extract.

Noni: Then and Now

The tireless pursuit of uncovering scientific knowledge to help us understand the actions of noni on human health is ongoing, in part due to an interest in finding mechanisms to explain why the traditional use of noni was, and continues to be, so prominent. Additionally, exciting new areas of interest currently undergoing clinical investigation include cognitive function and athletic endurance.

SAFETY

Numerous toxicity tests and a clinical study have been performed to ensure the safety of noni juice. More recently, an HPLC lab analysis of noni fruit puree found it to be void of potentially genotoxic anthraquinones, alleviating any safety concerns about these compounds that are found in the noni root. The European Commission (EC) approved noni fruit juice as a novel food in 2003. This action gives much credence to the safety of noni, as EC regulations are strict and require scientific evidence showing that novel foods do not present a danger for the consumer.
